01 AC Anterior Commissure

AI tutor

The anterior commissure is a compact white-matter bundle crossing the midline at the base of the septum pellucidum. On this axial slice, find the small bright band just anterior to the columns of the fornix.

△ Fair — 2.6 mm

AI tutor

Not quite — 2.6 mm off. Your placement sits on the fornix columns, just posterior to the AC. The AC is the brighter bundle immediately anterior. You're at 2 mm resolution — switch to 1 mm (RES) and zoom in to resolve the border.

You

why is it hard to see on T1?

AI tutor

On T1 the AC has similar intensity to surrounding white matter. Use the coronal plane at the midline, where it appears as a distinct oval crossing between the hemispheres.
